

PHYS 230 - Electricity and Magnetism

Lecture 6

Instructor: Saeed Rastgoo

**UNIVERSITY
OF ALBERTA**

Outline

1 Electric Charge and Electric Field

- Charge Distributions (Continued)
- Electric Field Lines

All figures in these slides are from one of the following sources, unless cited otherwise:

University Physics With Modern Physics, Young & Freedman

Physics for Scientists and Engineers, Hawkes, et al.

Physics for Scientists and Engineers With Modern Physics, Serway, Jewett

Exercise I

<https://epoll.srv.ualberta.ca> – Code: MBD

Exercise 2

<https://epoll.srv.ualberta.ca> – Code: MBD

Two infinite plane sheets with uniform surface charge densities $+\sigma$ and $-\sigma$ are placed parallel to each other with separation d . Find the electric field between the sheets, above the upper sheet, and below the lower sheet.

Exercise 2

<https://epoll.srv.ualberta.ca> – Code: MBD

Exercise 2

<https://epoll.srv.ualberta.ca> – Code: MBD

Exercise 3

<https://epoll.srv.ualberta.ca> – Code: MBD

Two long parallel plates are separated by a distance of 1 cm as seen in the figure. The field between the plates is a uniform one and is $\mathbf{E} = 1 \times 10^4 \hat{\mathbf{j}} \text{ N/C}$. Suppose that we choose a certain coordinate system where the x-axis is parallel to the two plates and exactly in the middle of the two plates. An electron with a charge $q = -e = -1.6 \times 10^{-19} \text{ C}$ and mass $m = 9.11 \times 10^{-31} \text{ kg}$ is released from $x = 0 \text{ cm}$ and $y = 0.1 \text{ cm}$ with an initial velocity $\mathbf{v}_0 = 3.00 \times 10^{11} \hat{\mathbf{i}} + 2.65 \times 10^{11} \hat{\mathbf{j}} \text{ m/s}$. What is the maximum vertical distance that it rises, and maximum horizontal distance that it traverses before hitting one of the plates?

Exercise 3

Electric Field Lines

An **electric field line** is an imaginary curve drawn through a region of space so that **its tangent at any point is in the direction of the electric field vector at that point.**

Figure 21.27 The direction of the electric field at any point is tangent to the field line through that point.

Electric Field Lines

Electric field lines

- Show the **direction of $\vec{E}$** at each point,

Figure 21.28 Electric field lines for three different charge distributions. In general, the magnitude of $\vec{E}$ is different at different points along a given field line.

(a) A single positive charge

Field lines always point away from (+) charges and toward (-) charges.

(b) Two equal and opposite charges (a dipole)

At each point in space, the electric field vector is *tangent* to the field line passing through that point.

(c) Two equal positive charges

Field lines are close together where the field is strong, farther apart where it is weaker.

Electric Field Lines

Electric field lines

- Show the **direction of $\vec{E}$** at each point,
- Their **spacing** gives a general idea of the **magnitude of $\vec{E}$** at each point
 - **The closer/farther the lines, the stronger/weaker the field**

Figure 21.28 Electric field lines for three different charge distributions. In general, the magnitude of $\vec{E}$ is different at different points along a given field line.

(a) A single positive charge

Field lines always point away from (+) charges and toward (-) charges.

(b) Two equal and opposite charges (a dipole)

At each point in space, the electric field vector is *tangent* to the field line passing through that point.

(c) Two equal positive charges

Field lines are close together where the field is strong, farther apart where it is weaker.

Electric Field Lines

Electric field lines

- Show the **direction of $\vec{E}$** at each point,
- Their **spacing** gives a general idea of the **magnitude of $\vec{E}$** at each point
 - **The closer/farther the lines, the stronger/weaker the field**
- Field lines **never intersect**, because **at any particular point, $\vec{E}$ has a unique direction** (not e.g., two directions, etc.), so only **one field line** can **pass through each point** of the field

Figure 21.28 Electric field lines for three different charge distributions. In general, the magnitude of $\vec{E}$ is different at different points along a given field line.

(a) A single positive charge

Field lines always point away from (+) charges and toward (-) charges.

(b) Two equal and opposite charges (a dipole)

At each point in space, the electric field vector is *tangent* to the field line passing through that point.

(c) Two equal positive charges

Field lines are close together where the field is strong, farther apart where it is weaker.

Electric Field Lines

For a positive point charge, the field lines are directed radially outward.

a

For a negative point charge, the field lines are directed radially inward.

b

Figure 23.19 The electric field lines for a point charge. Notice that the figures show only those field lines that lie in the plane of the page.

Electric Field Lines

The number of field lines leaving the positive charge equals the number terminating at the negative charge.

Figure 23.20 The electric field lines for two point charges of equal magnitude and opposite sign (an electric dipole).

Figure 23.21 The electric field lines for two positive point charges. (The locations A, B, and C are discussed in Quick Quiz 23.5.)

Two field lines leave $+2q$ for every one that terminates on $-q$.

Figure 23.22 The electric field lines for a point charge $+2q$ and a second point charge $-q$.
